

ABSTRACT OF THE DISCLOSURE

The present invention further improves conventional film transfer devices to provide a film transfer device that can be more conveniently used. The film transfer device comprises a case containing two film transfer sets. The sets mainly include delivery reels, respectively, around which corresponding transfer tapes having films on substrate tapes are wound and which deliver the corresponding transfer tapes for use, transfer heads respectively, each of which presses the corresponding transfer tape against a film-transferred surface to transfer the film to the surface, and windup reels, respectively, around which the corresponding tapes after transfer are wound up. The transfer tapes include films for corrections which have different widths. Either of the transfer tapes can be properly selected depending on the film-transferred area.
